

Eric Kempf, Brock Lehnert Homework 3

Exercise 2:

- a. Focus factor = actual velocity/available man-days = $32/45 = .711$
This sprint: $12+15+45 = 72$ man-days $72 * 0.711 = \underline{51.2 \text{ story points}}$
- b. In class we went over how the average focus factor is about 70%, so we use this for brand new teams.
- c. Another way to estimate story points is to go around and ask everyone to say out loud how hard they think the project will be. This is a worse system however, because it gets rid of the anonymity of voting with the cards, which could lead to anchoring.
